Lab 04

Objectives and Outcomes

In this assignment, you will Build a simple checkout feature for an e-commerce website. Users can add/remove products in the cart, update products quantity, update total price, and then submit an order via a checkout form. The form must be validated before submission.

Assignment Requirements

1. Display a list of products in the cart.
2. A shopping cart is managed with useReducer:
    - Each cart item shows: product name, unit price, quantity, a Remove button
    - Allow updating quantity of each cart-item in Cart.
    - Show cart summary: total quantity, total price.
3. Create a checkout form using Formik and validate it using Yup:
   The form must include:
    - fullName (required, min length)
    - email (required, valid email)
    - phone (required, must match a pattern)
    - address (required)
    - paymentMethod (required, radio/select: COD / Card)
    - agreeTerms (must be checked)

   Validation rules must be handled only by Yup. Form shows validation errors correctly.

4. Integration Between Cart and Form:
    - The form submit button must be disabled if the cart is empty.
    - When the user submits successfully, show an **order confirmation summary** on screen:
        - customer info
        - cart items
        - total quantity, total price
        - Clear the cart after successful submission.

Run your React app and see the result

Conclusions

In this Lab you learnt to use useReducer, Formik and Yup in React application.
